

SpotHitch — Generative AI Disclosure

In compliance with NLNet's Generative AI Policy, here is a summary of how AI was used in preparing this application.

Model used

Claude Opus 4.6 (Anthropic) via Claude Code CLI

What AI was used for

- **Research:** analyzing previously funded NLNet projects (Karrot, Seppo, Briar, Galene, Aral Balkan) to understand application structure and what makes proposals successful or rejected
- **Budget structuring:** organizing milestones and verifying pricing is realistic compared to accepted projects
- **Fact-checking:** verifying claims about OwnTracks, Grid, Life360, and other tools mentioned in the comparison section
- **Formatting:** structuring the proposal fields to fit character limits

What AI was NOT used for

- The final text was written by me (Antoine) in my own words in French
- Translation to English was done by my sister
- All product decisions, feature descriptions, and personal experiences are my own

Key prompts used (summary)

March 2026

Analyze 50 NLNet funded projects to understand budget structure, milestone format, and what makes proposals accepted or rejected.

Compare our budget (46 000 EUR, 15 milestones) with Karrot (20K, no milestones) and Seppo (50K, 13 milestones). Are we in the right range?

What professionals should we include in the budget to go beyond AI-assisted development? (developer code review, cryptography expert, UX researcher, designer, translator, lawyer)

Verify: does OwnTracks have check-in timers or SOS features? Does Grid have automatic alerts? Has Life360 been sued for selling user data?

How many technical challenges do accepted NLNet projects typically list? Seppo lists 1, Karrot lists 3, Galene lists 5. What's the right number for us?

How do accepted projects describe their ecosystem and sustainability plan? Compare Karrot, Seppo, CityBikes approaches.

Our app already has a prototype of Guardian and SOS modes. How do we explain why we need funding for something that partially exists? Look at how Briar and Karrot handled this.

Note: The AI helped me research and organize my ideas. It did not write the proposal. Every word in the submitted application was written by me based on my 10 years of hitchhiking experience and my vision for the project.

AI use in SpotHitch development

I use Claude Code (Anthropic) as an AI-assisted development tool for building SpotHitch. I have no formal programming training. The AI helps translate my product decisions into code. Every commit in the project's git history is marked with Co-Authored-By: Claude for full transparency. Usage will be documented in the project README as per NLNet's policy.
